The Perfect Iris Photo Guide

Six simple steps for capturing a sharp, naturally lit iris photo — the foundation for a mosaic you'll treasure for years.

Every photo tells a story — let's make sure yours tells it beautifully.

STEP 1

Clean the lens and choose soft light

Start with a clear lens and bright, indirect light from a window or shaded area.

- Wipe the phone lens before you begin.
- Face a bright window, but keep direct sun and harsh reflections out of the eye.
- Turn off beauty filters, portrait blur, and flash.

STEP 2

Use the rear camera

The rear camera normally captures more detail than the selfie camera.

- Ask another person to take the photo when possible.
- Use the standard photo mode at the camera's native resolution.
- Avoid digital zoom, screenshots, and images downloaded from social media.

STEP 3

Hold the phone steady

Sharp iris texture matters more than filling every pixel of the frame.

- Brace the phone or your elbows and tap the eye to focus.
- Keep a safe, comfortable distance and move closer only while focus remains sharp.
- Take several photos so you can choose the clearest one.

STEP 4

Look slightly beside the lens

A small change in gaze can move bright reflections away from the iris.

- Keep the eyelids comfortably open without stretching them.
- Look just beside the camera if the photographer or phone appears as a large reflection.
- Keep lashes, hair, and glasses away from the visible iris where practical.

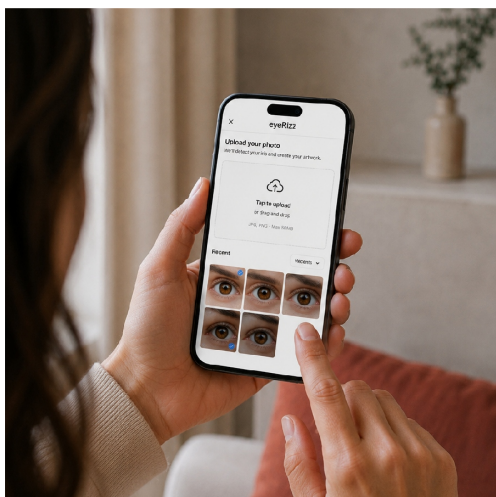

STEP 5

Check sharpness at full size

Zoom into the saved photo and inspect the fine lines of the iris.

- The iris fibres should look crisp rather than smeared or pixelated.
- Retake the image if the pupil is sharp but the iris texture is not.
- Choose natural colour over heavy sharpening or saturation filters.

STEP 6

Upload the original file

Send eyeRizz the highest-quality file your camera created.

- Upload the original photo directly from the device.
- Do not crop tightly; eyeRizz needs a little surrounding eye area for accurate placement.
- If you are unsure, upload the sharpest two or three options and compare them in the flow.

The moment your mosaic begins

This is the photo eyeRizz builds everything from. A few extra seconds here means a piece you'll treasure for years.

Aim for this

- Soft, bright, indirect light
- Crisp visible iris fibres
- Minimal glare across the iris
- Original full-resolution camera file
- A little space around the eye

Avoid this

- Flash or direct sun
- Motion blur or missed focus
- Beauty filters and portrait blur
- Screenshots and social-media copies
- Hair, glasses, or deep shadow covering the iris

Turn it into something you'll treasure forever.

Make My Mosaic

Thank you for trusting us with something this personal — we can't wait to see what you create.
